PALEY'S Natural Theology though not by any means an epoch-making may perhaps be called an epoch-marking book. It was the crown of the endeavour of eighteenth-century religious philosophy to found a theology on the evidences of external nature. According to such exact knowledge of Nature's operations as was then generally available, Paley's attempt might well be thought to have succeeded. He opens his argument with a striking and effective illustration. He imagines a wayfarer crossing a heath who strikes his foot against a stone, and who asks himself how it came into being. Paley thinks he might be content with vaguely supposing that it was there 'always.' But suppose that what he had found at his foot was not a stone but a watch and that he now saw such an instrument for the first time. He would then certainly have not been so easily contented with an answer to the riddle of its existence. He would, if he examined it minutely, have observed that it was a structure intended for a certain purpose, and having all its parts arranged for that object, and mutually interdependent The different substances of which it was composed would be discovered to have each its special appropriateness for the fulfilling of some particular function in the economy of the whole. Though unacquainted with watches he would, if he was a man of sense and cultivation, infallibly conclude that he had before him an instrument intelligently constructed with a certain object in view—the object of measuring the flight of time. He would feel assured of this, even though he should find that the object of the mechanism were not attained with absolute accuracy, and even though there were some parts of it whose functions were not clear to him. The watch would be rightly regarded as a work of design; and the observer would be justified in arguing from it to the existence of a designer, endowed with the faculties of intelligence and conscious purpose, by whom the watch must have been put together. The rest of Paley's Natural Theology is an application of this analogy to the question of the origin of the universe. Ranging over the whole field of animate and inanimate nature he points to instance after instance of what appears to be the minute and thoughtful adaptation of means to ends, the co-ordination of part with part in the interest of the whole, and he has no difficulty, from this point of view, in showing the world of nature to be a piece of mechanism far more wonderfully and ingeniously constructed than any watch, and bearing prima facie evidence of the most convincing kind of its construction by a Being possessed of intelligence, purpose and foresight precisely resembling those attributes as displayed by man, but vastly heightened and enlarged. As the watch must have been made by man, so a manlike being, endowed with the necessary powers and faculties, must be postulated as the maker of the material universe. And thus the existence of a God made in the image of man appeared to have been demonstrated to the satisfaction of

eighteenth-century theology. *Inhibition and Destruction of the Microbial Cell* focuses on the effects of various classes of toxic chemical agents on microbial cell. This book is organized into 14 chapters that cover the topics from two points of view: the agent and the target (the microbial cell). The introductory chapters are devoted to the inhibitory effects of elevating temperature and to the lethal effect of environmental thermal energy supply restriction on growing bacteria. A chapter focuses on the effect of various classes of antibacterial compounds, such as 4-amino-quinolindium and 8-hydroxyquinoline derivatives, chlorhexidine, amidines, halogens, dyes, and nitrofurans. The subsequent chapters examine the effects of other chemical agents on microorganisms, including toxic gases, solutes, ions, and radiations. The book goes on examining the inhibition and destruction of specific microorganisms, such as *Pseudomonas aeruginosa*, Enterobacteriaceae, Mycobacteria, Cocci, bacterial spores, molds, yeasts, and viruses. The last chapter discusses the effect of the cultural prehistory of microorganisms upon their response to inhibition and destruction. This book is an invaluable resource for graduate research workers and scientists in pure and applied microbiology. This will also be a good reference for undergraduates reading specialized courses at honors level in microbiology or applied courses in food science and agriculture. Furthermore, it will be of interest to the medical profession, especially those involved in public health and pathology, as well as to scientists in the pharmaceutical industry. Today, courses on biophysics are taught in almost all universities in the world, often in separate biophysics departments or divisions. This reflects the enormous growth of the field, even though the problem of its formal definition remains unsettled. In spite of this lack of definition, biophysics, which can be considered as an amalgamation of the biological and the physical sciences, is recognized as a major scientific activity that has led to spectacular developments in biology. It has increased our knowledge of biological systems to such an extent that even industrial and commercial interests are now beginning to put their stamps on biological research. A major part of these developments took place during the last two decades. Therefore, an introductory textbook on biophysics that was published a dozen years ago (c. Sybesma, *An Introduction to Biophysics*, Academic Press, 1977) no longer could fulfil " ... the need for a comprehensive but elementary textbook ... " (R. Cammack, *Nature* 272 (1978), 96). However, because of the increased proliferation of biophysics into higher education, the need for introductory course texts on biophysics is stronger than ever. This fact, together with valuable comments of many readers, have encouraged me to revise the original book.

Make sense of the new regulatory requirements with expert clarification and practical tools for compliance *Private Foundations: Tax Law and Compliance, 5th Edition* provides clarification, expert insight, and helpful instruction for executives and supporting professionals navigating extensive federal tax law requirements. Despite their relatively low numbers, private foundations are subject to complex, burdensome regulations that continue to expand; the recent tax overhaul has compounded this issue, bringing massive changes beyond the usual annual adjustments, and throwing a wrench into the status quo of compliance-as-usual. This book summarizes and clarifies the statutory regulations governing private foundations, offers expert insight into the underlying logic, and provides a host of practical tools that ease the filing process and help ensure compliance with the latest laws. Detailed explanations are bolstered by checklists, sample documents and letters, practice forms, and real-world examples in order to provide both conceptual and practical guidance for maintaining tax-exempt eligibility and tax compliance. By untangling the complex maze of constantly-evolving requirements, this book offers a much-needed resource to those tasked with ensuring compliance amidst regulatory changes year after year. Learn how the recent changes to tax laws affect private foundations and related organizations *Understand the practical implications of maintaining compliance* Access critical tools that help streamline the filing process *Avoid mistakes and oversights with line-by-line instruction* This book is updated annually to provide guidance based on the most recent iteration of the law, but this year's edition is unusually critical; federal law has undergone sweeping changes that will substantially alter filings across the board, and the complex nature of the regulations governing private foundations promises additional confusion as the new laws are applied. *Private Foundations: Tax Law and Compliance, 5th Edition* provides insight, clarification, and explanation from the nation's leading authority on tax-exempt organizations to help private foundations maintain compliance amidst the changes. Fully updated to meet the demands of the 21st-century surgeon, *Plastic Surgery* provides you with all the most current knowledge and techniques across your entire field, allowing you to offer every patient the best possible outcome. In spite of ingenious experiments, imaginative theories, and unshakable faith in supreme forces, there is no way to know how life began. What is certain is that in the course of the development of the universe existing sources of energy fused to generate atoms, and atoms mingled to become small molecules. At some point by chance or design-according to one's belief, but no one's evidence-small molecules such as hydrogen, oxygen, carbon dioxide, water, and ammonia reacted to

yield larger molecules with the property most essential to life: self-replication. Such molecules had to achieve a proper balance between the stability needed for their survival in the environment and the mutability for the generation of many forms of life. How amino acids were created or how DNA, RNA, and proteins developed remains a mystery. But we know that a simple core of nucleic acid embedded in a protein coat made the simplest unit of life (except for viroids). Whether viruses are a primitive or degenerated form of life is not known. Once proteins appeared, their great structural plasticity allowed them to react with other elements such as sulfur, iron, copper, and zinc. After an incalculable number of years, some of the proteins became capable of catalyzing the synthesis of new nucleic acids, new proteins, and other compounds such as polysaccharides and lipids. This novel, multidisciplinary handbook highlights recent evidence that antigen presenting cells (APCs) are not only key players in the initiation or prevention of an antigen-specific T lymphocyte-mediated adaptive immune response, but also critical regulators and integrators in the interplay between our innate and adaptive immune system. Structured in a clear way to allow access to a very broad readership, the book is written from the viewpoint of a biochemist, immunologist, and scientist with experience in drug development. It covers all cell types involved in antigen presentation, providing the latest immunological facts with a focus on drug development. Backed by a glossary explaining all important technical terms, this short but comprehensive reference covers basic introductory aspects right up to details for advanced specialists.

Fix a Super Bowl? I never thought it possible, but 4th and Fixed is so chock-full of NFL skinny that it sweeps you along from the field to the front office and makes you believe. --Frank Deford

Methods in Cell Biology Fast-moving and ever-changing, stem cell science and research presents ongoing ethical and legal challenges in many countries. Each development and innovation throws up new challenges. This is the case even where new developments initially seem to solve old dilemmas. Sometimes it becomes evident that new science does not in fact solve old problems and, for that reason, the ethical issues remain. In recognition of this, this book presents innovative and creative analyses of a range of ethical and legal challenges raised by stem cell research and its potential and actual application. The editors.

Monoclonal Antibodies: Probes for the Study of Autoimmunity and Immunodeficiency focuses on the research/studies using monoclonal antibodies in two major classes of diseases, which are autoimmunity and immunodeficiency. The book comprises of 14 chapters; each is written in detail and includes studies using monoclonal antibodies of the pathogenesis and treatment of various types of diseases of disordered immunity. The first chapter presents an overview of the use of monoclonal antibodies in the study of autoimmunity and immunodeficiency. The following chapters focus on other monoclonal reagents and their uses and applications to different diseases. The last four chapters discuss specific classic endocrine diseases in reference to discoveries regarding the beginning of autoimmune mechanisms and pathophysiology. Because the book is technically written, students with background in biology, microbiology, and biochemistry are most likely the target audience of this book. Other parties in the fields of immunology, clinical medicine, pathology, and physiology will also find this book a good reference material.

Electronics has become the largest industry, surpassing agriCULTure, auto. and heavy metal industries. It has become the industry of choice for a country to prosper, already having given rise to the phenomenal prosperity of Japan. Korea. Singapore. Hong Kong. and Ireland among others. At the current growth rate, total worldwide semiconductor sales will reach \$300B by the year 2000. The key electronic technologies responsible for the growth of the industry include semiconductors. the packaging of semiconductors for systems use in auto, telecom, computer, consumer, aerospace, and medical industries. displays. magnetic, and optical storage as well as software and system technologies. There has been a paradigm shift, however, in these technologies. from mainframe and supercomputer applications at any cost. to consumer applications at approximately one-tenth the cost and size. Personal computers are a good example. going from \$500/MIP when products were first introduced in 1981, to a projected \$100/MIP within 10 years. Thin. light portable. user friendly and very low-cost are. therefore. the attributes of tomorrow's computing and communications systems. Electronic packaging is defined as interconnection. powering, cooling, and protecting semiconductor chips for reliable systems. It is a key enabling technology achieving the requirements for reducing the size and cost at the system and product level.

'Curveball' was the codename given to the mysterious defector whose first-hand evidence on Saddam's weapons of mass destruction proved vital in giving the Bush administration the excuse it needed to invade Iraq. The only problem - this 'evidence' was nothing more than a pack of lies. Pulitzer Prize-winning journalist Bob Drogin has written the definitive account of the most notorious intelligence fiasco in US history, revealing how squabbling, arrogance and incompetence within the various intelligence agencies allowed one man's lies to spread higher and higher up the chain of authority, eventually reaching the White House itself. Breathlessly paced and shockingly revelatory, Curveball is an explosive true-life account of how honour and dishonesty amongst spies led to the UK and the US becoming embroiled in a catastrophic war. The twisty follow-up to the Hillerman Prize-winning *The Territory*, featuring tough smalltown Texas police chief Josie Gray It was pure luck that Josie Gray spotted Cassidy Harper's car, abandoned on the side of the road. If she hadn't, then she'd never have found Cassidy, lying nearly dead of heatstroke on the desert sand beside the body of a Mexican immigrant. But Cassidy can't explain why she was out for a walk in the midday desert heat, let alone how she happened upon the corpse. And once Josie sees the ominous wounds on the man's body, she knows she needs to find the answer fast, before her own life is in danger. Tricia Fields's *The Territory* marked her as talented new author of Southwestern crime, and *Scratchgravel Road* marks an inventive new mystery set in the unique world of smalltown Texas. Cell membranes are the initial and focal sites

of stimulus perception and signal transduction. Membrane lipids are rich sources for the production of signaling messengers that mediate plant growth, development, and response to nutrient status and stresses. In recent years, substantial progress has been made toward understanding lipid signaling in plants, but many fundamental questions remain: What lipids are signaling messengers or mediators in plants? How are the signaling lipids produced and metabolized? In what plant cellular and physiological processes are various lipid mediators involved? How do they carry out their signaling functions? How do lipid signaling networks contribute to modulating plant growth, development, and responses to hormones and stresses? In this Research Topic issue, we invite the broad plant community to address the above questions. Cell membranes are the initial and focal sites of stimulus perception and signal transduction.
